

Minutes of Meeting (MOM)

Sales Copilot Solution - Architecture & Implementation Discussion

Date: January 5, 2026

Topic: AI-Powered Sales Copilot Solution Architecture

Presenter: Jean-Paul Saliou

Background: Developed during transition from Synopsys (4 years building analytics teams and corporate strategy)

1. Executive Summary

Jean-Paul Saliou presented a unified AI-powered copilot solution designed to enhance sales team productivity by integrating structured data from enterprise data warehouses with unstructured knowledge repositories. The solution provides a "one-stop shop" for sales intelligence, accessible through existing platforms salesforce teams already use daily (Salesforce, Microsoft Teams, Outlook, Slack) without requiring context-switching between tools[1].

2. Core Concept & Value Proposition

Solution Overview

The copilot is fundamentally a **unified AI-powered interface** that:

- Blends **structured data** (from Snowflake data warehouses) with **unstructured knowledge** (PDFs, PowerPoints, product documentation)
- Provides single interface access for sales teams
- Eliminates need to switch between multiple specialized tools
- Integrates directly into platforms salesforce teams use daily

Key Value Drivers

- **Seamless Integration:** Embeds into Salesforce, Microsoft Teams, Slack, Outlook
 - **Unified Information Access:** Answers questions by querying both structured and unstructured data
 - **Enhanced Productivity:** Single interface replaces multiple tool switching
 - **Context Preservation:** Maintains workflow within tools sales reps already use
-

3. Key Requirements & Foundation

Customer 360 Dashboard Enhancement

The solution builds upon a traditional **Customer 360 dashboard** (originally built in Tableau):

Current Dashboard Capabilities:

- Account information display
- Booking metrics and revenue tracking
- Financial data analysis
- Competitive intelligence metrics
- Marketing activities for accounts (e.g., Nvidia)
- Multiple daily refreshes
- KPI and overview metrics

Copilot Enhancement:

- Extends dashboard functionality beyond static metrics
- Enables conversational queries on dashboard data
- Handles detailed questions and custom filtering
- Complements rather than replaces traditional BI dashboards

Role as Complementary Tool

The copilot is explicitly positioned as **complementary to BI dashboards, not a replacement**:

- **BI Dashboards:** Provide KPIs, overview metrics, standardized views
 - **Copilot:** Handles detailed questions, custom filtering, ad-hoc analysis
 - **Synergy:** Work side-by-side to provide comprehensive intelligence
-

4. Data Integration Strategy

Architecture Components

The solution integrates three distinct data sources:

4.1 Structured Data (Snowflake)

- Customer transactions and transactional history
- Financial data (revenue, bookings, margins)
- Competitive information and market data
- Real-time and historical data warehouse content
- Multiple daily refreshes capability

4.2 Unstructured Knowledge Base

- Product documentation and specifications
- PDF technical documents and whitepapers
- PowerPoint presentations and training materials
- Internal knowledge repositories
- Marketing collateral and sales enablement materials

4.3 External Public Data

- Publicly available company information
- Quarterly earnings reports and financial filings
- Competitive intelligence data from web sources
- Industry benchmarks and market research
- Real-time web-sourced information

Integration Approach

Rather than maintaining separate user interfaces for different data types, the copilot embeds a **unified query engine** that:

- Routes queries to appropriate data sources
- Combines structured and unstructured results
- Maintains context across data types
- Enables complex multi-source queries

5. Technical Implementation

Snowflake Cortex Platform

The solution leverages **Snowflake's Cortex platform** for AI-native capabilities:

5.1 Cortex Search Capability

- **Purpose:** Query both structured data and PDF/knowledge base content
- **Functionality:** Natural language search across hybrid datasets
- **Use Cases:** Product information retrieval, knowledge base queries, document search
- **Integration:** Searches unstructured PDFs and knowledge repositories alongside structured data

5.2 Cortex Analyst Capability

- **Purpose:** Advanced analysis of structured financial and customer data
- **Functionality:** Complex financial analysis, customer behavior analysis, trend identification
- **Features:** Multi-dimensional analysis, comparative analysis, forecasting
- **Data Sources:** Snowflake data warehouse structured datasets

5.3 Agent Orchestration Layer

- **Purpose:** Intelligent query routing mechanism
- **Functionality:** Routes user queries to appropriate Cortex capability
- **Logic:** Determines whether query requires Search (unstructured) or Analyst (structured) capability
- **Advantage:** Moves beyond simple prompts to intelligent orchestration
- **Benefit:** Ensures optimal capability utilization based on query type

Architecture Advantages

- **Native AI Integration:** Snowflake Cortex provides built-in AI without external tool complexity
 - **Data Co-location:** No data movement between systems
 - **Security:** Inherits Snowflake's enterprise security model
 - **Performance:** Optimized for Snowflake's data warehouse architecture
 - **Scalability:** Handles enterprise-scale data volumes
-

6. Use Cases & Applications

Sales representatives can now ask natural language questions and receive comprehensive answers:

6.1 Knowledge Base Queries

- **"Tell me about product XYZ"** → Pulls relevant information from product documentation and knowledge base
- **Benefit:** Quick access to product specifications without manual document search

6.2 Structured Data Analysis

- **"What did this customer buy in 2024?"** → Queries transactional data in Snowflake
- **Benefit:** Historical customer behavior analysis without complex report generation

6.3 Multi-Source Analysis

- **"Who are the top customers in China for 2025?"** → Combines structured revenue data with external market intelligence
- **Benefit:** Market-specific insights combining internal and external data

6.4 Competitive Intelligence Integration

- **"Tell me about this customer" followed by competitive insights** → Blends internal customer data with competitive landscape analysis
- **Benefit:** 360-degree account intelligence for sales conversations

6.5 Ad-Hoc Queries

- Custom filtering and analysis questions
 - Account-specific questions
 - Time-based analysis and comparisons
 - Contextual insights for sales conversations
-

7. User Experience Considerations

7.1 Security and Access Control

Implementation: Role-based security architecture

Key Features:

- Users only see data they're authorized to access
- Example: Sales representatives see only assigned customer accounts
- Inheritance from Snowflake and platform-level access controls
- Granular permission management per user role
- Audit trails for compliance and governance

Benefit: Enterprise-grade security without compromising user experience

7.2 Platform Flexibility & Technology Stack

Philosophy: Enhance existing technology, not introduce new systems

Flexibility in Data Warehouse:

- While Jean-Paul's experience centers on Snowflake and Tableau
- Copilot is not locked to these specific tools
- Can integrate with **Power BI** instead of Tableau
- Technology choice drives implementation approach, not solution design
- Goal: Work with customer's existing tech stack

Flexibility in UI/UX Development:

- Can use **Streamlit** for custom UI development
- Can embed directly into existing platforms (Salesforce, Teams, Outlook)
- Multiple deployment options based on customer preference
- No single mandated technology choice

Strategic Benefit: Reduces implementation complexity, leverages existing investments, accelerates adoption

7.3 Integration Points

The copilot integrates with:

- **Salesforce** (chatbot embedding)
 - **Microsoft Teams** (copilot integration)
 - **Slack** (bot integration)
 - **Outlook** (similar to Gmail's Gemini integration)
 - Custom UI/UX via Streamlit or similar tools
-

8. Positioning & Market Context

BI Complementarity, Not Replacement

The solution is intentionally designed to **coexist with traditional business intelligence**:

Distinct Roles:

- **Traditional BI/Dashboards:** Standardized KPIs, executive overviews, performance metrics
- **Copilot:** Conversational intelligence, detailed analysis, custom filtering, ad-hoc queries

Working Together:

- Sales teams access dashboards for quick metrics
- Deeper questions flow to the copilot
- Copilot feeds insights back to dashboard context
- Complementary workflows, not competing tools

Enterprise Readiness

The solution addresses enterprise requirements:

- Role-based security with granular access control
- Enterprise data governance and compliance
- Scalable architecture on Snowflake platform
- Integration with existing sales technology stacks
- Support for multiple deployment models

9. Next Steps & Implementation Considerations

Areas for Further Development

1. **UI/UX Finalization:** Decision on Streamlit vs. direct platform embedding vs. custom development
2. **Data Migration:** Planning for knowledge base ingestion (PDFs, PowerPoints, documentation)
3. **Pilot Program:** Identify early adopter accounts for beta testing
4. **Security Certification:** Formal security validation and access control testing
5. **Performance Tuning:** Optimization of Cortex Search and Analyst query performance
6. **User Training:** Sales team enablement on copilot capabilities

Success Metrics

- User adoption rate across sales team
- Time saved per sales representative per week
- Query accuracy and response quality
- Integration stability with Salesforce/Teams/Slack
- Data freshness and update frequency
- User satisfaction scores

10. Key Takeaways

- **Unified Solution:** Single AI copilot interface replaces multiple specialized tools for sales intelligence
- **Hybrid Data Model:** Seamlessly combines structured (Snowflake) and unstructured (knowledge bases) data
- **Platform Native:** Embeds into existing sales workflows (Salesforce, Teams, Outlook, Slack)
- **Intelligent Routing:** Agent orchestration ensures appropriate capability utilization (Search vs. Analyst)
- **Complementary Design:** Enhances BI dashboards without replacing them
- **Enterprise Secure:** Role-based access control and granular security
- **Technology Flexible:** Works with customer's existing tech stack (Tableau/Power BI, Snowflake/other warehouses)
- **Conversational Intelligence:** Enables natural language questions vs. complex report generation
- **Comprehensive Insights:** Blends internal customer data, financial metrics, and external intelligence
- **Sales Productivity:** Reduces context-switching and information gathering time
